

SRG Class A Fuel Burn Crib

SRG burn cribs help reduce the amount of heat that is transferred to the floor. Conventional burn cribs allow the hot coals to fall through and lay on the floor. This causes a rapid increase in the floor temperature in one small area. This type of rapid heating stresses the floor and leads to premature cracking, spalling and many other detrimental structural affects.

\$850.00

- 44" x 57" Platform raised 12 inches from the floor surface
- Reduce the heat load on concrete floor and metal floors
